# Testing pleiotropy in multiparental populations

Frederick Boehm

April 22, 2019

# Introduction

- 10,000+ traits with RNA sequencing and mass spectrometry

- Multiparental populations offer high-resolution QTL mapping

- New analysis tools, such as a pleiotropy test for multiparental populations, are needed

# Jiang and Zeng (1995) test

- Two-parent crosses

- Applies to two traits that co-map

- $H_0$: Pleiotropy

- $H_A$: Two separate QTL

# Jiang and Zeng (1995) test

- Perform a two-dimensional two-QTL scan

    - $vec(Y) = Xvec(B) + vec(E)$

    - Calculate likelihood at each ordered pair of positions

- Calculate likelihood ratio test statistic

# Multiparental populations

# Challenges in multiparental populations

- Complex patterns of relatedness

*Multivariate random effects*

- Multiple founder lines

*Fixed effect for each founder allele*

# Test procedure

- Perform a two-dimensional two-QTL scan

    - $vec(Y) = Xvec(B) + vec(G) + vec(E)$

    - Calculate likelihood at each ordered pair of positions

- Calculate likelihood ratio test statistic
# Test procedure

- Test statistic: $-\log_{10} \max$

- Parametric bootstrap to get a p-value
# Application

- Logan, et al. (2013) and Recla, et al. (2014) studied 261 Diversity Outbred mice

- Measured about two dozen behavioral traits

- Two traits map to Chr 8:

  - "hot plate latency" (57 cM)

  - "percent time in light" (55 cM)

# Allele effects plots

# Profile LOD

$$\text{profile LOD}_{\text{trait 1}}(\lambda_1) = \max_{\lambda_2} LOD(\lambda_1, \lambda_2)$$

percent time in light and hot plate latency

# Test results

- $\log_{10} \Lambda = 1.2$

- p = 0.11 (1000 bootstrap samples)

# Power study with local expression QTL

# Power study: Design

- Examine power when I know true eQTL locations

  ○ Interlocus distance
  ○ Univariate LOD

- 80 local eQTL on Chr 19 (LOD > 7.2)

- 4 strong, centrally located, local eQTL chosen as "anchor" traits

  ○ Asah2, Lipo1, Lipo2, 4933413C19Rik

- Pairwise pleiotropy tests each involving one anchor and one of 79 other traits

# Power study: Interlocus distance
# Power study: Univariate LOD
# Power study: Conclusions

- \uparrow Interlocus distance \longrightarrow \uparrow Pleiotropy test statistics

- \uparrow Univariate LOD \longrightarrow \uparrow Pleiotropy test statistics

# qtl2pleio R package

# qtl2pleio R package

- Functions for d-variate, d-QTL scan & profile LOD plots

- Uses C++ for matrix calculations (via Rcpp and RcppEigen)

- Uses `gemma2` R implementation of GEMMA EM algorithm for multivariate random effects

- Unit tests, vignettes, and version control

Thank you!
